

Dataset Curation Strategies for Coherence Metrics in Low-Rank Models

Validation and Generalization Team

2025

Introduction

Key Finding

- ▶ **No single coherence metric or validation approach is universally optimal**
- ▶ Different metrics capture different aspects of model quality
- ▶ Multi-faceted validation strategies required
- ▶ Combines mathematical rigor with practical implementation

Overview

- ▶ Mathematical foundations and statistical requirements
- ▶ Domain-specific dataset curation strategies
- ▶ Methodological guidance and implementation
- ▶ Bias detection and ethical considerations
- ▶ Reproducibility standards

Mathematical Foundations

Core Coherence Metrics

- ▶ **Pointwise Mutual Information (PMI)** and normalized variant (NPMI)
- ▶ **UMass coherence**: Co-document frequency based
- ▶ **CV coherence**: Weighted similarity measures
- ▶ Matrix factorization: $M \approx UV^T$
 - ▶ Reconstruction error minimization
 - ▶ Regularization objectives

Statistical Requirements

- ▶ **Minimum samples:** 100 per expected cluster/topic
- ▶ **Optimal datasets:** 1000+ samples
- ▶ **Matrix condition numbers:** $< 10^{12}$
- ▶ **Sparse matrices:** $\geq 1\%$ density

Computational Complexity

- ▶ SVD: $O(\min(m^2n, mn^2))$ for $m \times n$ matrices
- ▶ PMI coherence: $O(|V|^2)$ where $|V|$ = vocabulary size
- ▶ Memory limits: $\sim 100\text{K} \times 80\text{K}$ matrices on 32GB systems

Domain-Specific Strategies

Text and NLP

Frameworks

- ▶ **Reinhart's Framework:**
 - ▶ Cohesion: Formal linking elements
 - ▶ Consistency: Logical semantic coherence
 - ▶ Relevance: Pragmatic constraints

Key Datasets

- ▶ **GCDC:** Real-world texts, 3-point coherence scales
- ▶ **CoheSentia:** GPT-generated stories, 5-point ratings
- ▶ **INSteD:** 170,000+ documents for intruder detection

Computer Vision

Visual Coherence Types

- ▶ Consistency in visual patterns
- ▶ Temporal coherence in video
- ▶ Spatial coherence in scenes

Key Datasets

- ▶ **Panda-70M**: 70.8M video clips
- ▶ **360+x**: Omnidirectional spatial coherence
- ▶ ImageNet/MS COCO adapted for coherence

Time Series Data

Temporal Coherence

- ▶ Synchronized patterns across series
- ▶ Seasonal consistency
- ▶ Causal relationships

Measurement Approaches

- ▶ Squared coherence (frequency domain)
- ▶ Cross-correlation (time domain)
- ▶ Spectral coherence (synchronization)

Scientific Datasets

Requirements

- ▶ Consistency with physical laws
- ▶ Mathematical relationships
- ▶ Domain-specific constraints

Key Resources

- ▶ **QM7-X**: 4.2M molecular structures
- ▶ **QCML**: 33.5M DFT calculations
- ▶ Materials Project

Social Networks

Structural Coherence

- ▶ Topology consistency
- ▶ Logical community grouping
- ▶ Temporal evolution patterns

Validation Approaches

- ▶ Community detection algorithms
- ▶ Centrality analysis
- ▶ Motif analysis

Methodological Guidance

Ground Truth Establishment

Approaches for Unsupervised Metrics

- ▶ **Human expert evaluation:** $\kappa \geq 0.7$ agreement
- ▶ **Synthetic data:** Controlled coherence properties
- ▶ **Intrinsic metrics:** UMass, UCI coherence
- ▶ **External validation:** Word embedding similarity

Cross-Validation Strategies

Stability-Based Validation

- ▶ Temporal stability testing
- ▶ Bootstrap resampling
- ▶ Perturbation analysis
- ▶ 5-10 fold cross-validation
- ▶ Flag $CV > 0.3$ as unstable

Data Splitting

Temporal Data

- ▶ Forward chaining
- ▶ Chronological splits
- ▶ Prevent data leakage

General Datasets

- ▶ 60% train / 20% validation / 20% test
- ▶ Stratified splitting
- ▶ Nested cross-validation

Synthetic Data Generation

Controlled Experiments

- ▶ Matrix factorization-based generation
- ▶ Known rank structure
- ▶ Controlled noise levels
- ▶ Predetermined coherence levels

Robustness Testing

- ▶ Gradient-based perturbations
- ▶ Semantic-preserving transformations

Implementation Considerations

Technology Stack

- ▶ **DVC + Git:** Dataset versioning
- ▶ **MLflow:** Experiment tracking
- ▶ **Apache Spark:** Large-scale processing
- ▶ **Great Expectations:** Data validation
- ▶ **Gensim:** Core coherence evaluation

Scalability Guidelines

Data Size	Framework
< 1GB	pandas, scikit-learn
1-100GB	Dask
> 100GB	Apache Spark
ML-heavy	Ray

Quality Control

Automated Assessment

- ▶ Completeness: 95% for critical fields
- ▶ Consistency: Annotation pattern analysis
- ▶ Validity: Range checking

Human-in-the-Loop

- ▶ Flag low-confidence samples
- ▶ Consensus labeling
- ▶ Inter-annotator agreement: $\kappa > 0.8$

Bias and Ethics

Bias Detection

HBAC Algorithm

- ▶ Hierarchical Bias-Aware Clustering
- ▶ Statistical significance testing
- ▶ Unsupervised detection

Mitigation Strategies

- ▶ Data reweighting
- ▶ Subgroup balancing
- ▶ Fairness-aware sampling
- ▶ Fairness constraints in algorithms

Quantitative Metrics

- ▶ **Demographic parity**
- ▶ **Equal opportunity**
- ▶ **Disparate impact ratios:** 0.8-1.2 acceptable

Privacy Protection

- ▶ Data minimization
- ▶ Anonymization protocols
- ▶ Differential privacy
- ▶ Stakeholder consultation

Reproducibility Standards

Bronze Standard

- ▶ Code availability
- ▶ Data documentation
- ▶ Environment specification
- ▶ Random seed control

Silver Standard

- ▶ Containerization
- ▶ Automated workflows
- ▶ Comprehensive version control

Gold Standard

- ▶ Continuous integration
- ▶ Cloud deployment
- ▶ Interactive documentation
- ▶ Long-term archival

Implementation Roadmap

Phase 1: Foundation

- ▶ Basic cross-validation
- ▶ Reproducibility protocols
- ▶ Core metric implementation

Phase 2: Enhanced Testing

- ▶ Bias detection
- ▶ Synthetic data generation
- ▶ Comprehensive evaluation

Phase 3: Production Ready

- ▶ Adversarial robustness
- ▶ Cross-domain validation
- ▶ Performance optimization

Phase 4: Maintenance

- ▶ Automated monitoring
- ▶ Quality assurance systems
- ▶ Continuous improvement

Performance Thresholds

Acceptance Criteria

- ▶ **Coherence scores:**
 - ▶ UMass: > 0.4
 - ▶ UCI: > 0.3
- ▶ **Stability:** $CV < 0.3$
- ▶ **Cross-domain transfer:** $< 20\%$ degradation
- ▶ **Bias metrics:** Impact ratios 0.8-1.2

Future Directions

Emerging Research

- ▶ Automated bias detection systems
- ▶ Causal inference integration
- ▶ Advanced synthetic data generation
- ▶ Cross-modal coherence validation

Evolving Best Practices

- ▶ Increasing emphasis on fairness
- ▶ Interpretability requirements
- ▶ Robustness standards
- ▶ Academic-industry collaboration

Conclusion

Key Takeaways

- ▶ No universal coherence metric exists
- ▶ Domain-specific adaptation crucial
- ▶ Multi-faceted validation essential
- ▶ Balance rigor with practicality

Impact

- ▶ Enables reliable unsupervised learning
- ▶ Supports diverse domain applications
- ▶ Promotes reproducible research
- ▶ Advances coherence metric development
